PREFACE

Further to the publication titled "Endemic Flowering Plants Part I, A Checklist & an Index to A Revised Handbook to the Flora of Ceylon" (2005) and "Endemic Flowering Plants Part II A, Index to the Distribution of Plants with Localities" (2006), this publication deals with the distribution of the taxa concerned, within the Agro Ecological Zones (AEZs.) of Sri Lanka. The content is divided into two Sections *viz:-*

Section I List of species in alphabetical order with their distribution according to the Agro-Ecological Zones (AEZs). The division of the AEZs is based on that of Arjuna (1997) and not on the recent Department of Agriculture (2003).

Section II List of species within Families in alphabetical order and their distribution according to the AEZs.

It is hoped that the information provided in this publication would be a useful guide on the distribution of the endemic plants, to the Scientists and the Researchers concerned.

Similar to Part I of this publication series, an Asterisk (*) in front or after a species name means that it is rare, while a "X" means that it is almost in the verge of extinction and a question mark (?) means that there is a doubt as to its endemism. It should be noted that a species where the AEZs is referred to as LUK means that the exact locality of that species is not known and Cul means the species in cultivation. Further for each species reference is provided to the Vol. No. of the "A Revised Handbook to the Flora of Ceylon" and the page the taxon appears.

AKNOWLEGMENTS

First of all I would like to acknowledge the Biodiversity Secretariat of the Ministry of Environment & natural resources for accepting my request to give financial assistance to publish the book.

I acknowledge with thanks the assistance and support to a large number of colleagues and friends. Although too numerous to mention individually, they are well remembered for their contributions.

I take this opportunity to sincerely thank Misses Sandya Kumari, Achala Basnagoda and Shakila Shamini for the assistance given in typing and in the preparation of the final manuscript and Ms Dakshini Perera of the Biodiversity Secretariat for doing final page adjustment and coordinating. Last but not the least I wish to thank Mr. Prageeth Wanigasooriya for helping me in designing the cover page and assisting me in various ways.

INTRODUCTION

Literally speaking an Endemic Plant is one that is found or grows in a specific area or habitat. In this respect Endemic Plants of Sri Lanka are those that are found growing only in Sri Lanka and no where else in the world. Little we realize that such plants have come to this state through a long process of evolution to survive in a specific locality under specific environmental conditions. Thus any disturbances or destruction to these specific environmental conditions of any form no doubt would eliminate these plants not only from Sri Lanka but from the world for ever. According to Abeywickrama (1987) out of the then known 850 endemic flowering plant species recorded from Sri Lanka about 230 could be considered as threatened (i.e. endangered, vulnerable or rare). At present we are in a state we know very little or nothing at all about these plants and the importance of their genetic resources. Even though it is late, it would be of great value if one was able to identify these plants and take necessary measures to preserve and conserve such valuable genetic resources for the future.

Based on the Revised Handbook to the Flora of Ceylon, Senaratna (2000) have shown that there are 4143 plant species recorded from Sri Lanka distributed within 214 families and 1522 genera. The present study reveals that out of the total number 4143 1025 species i.e. 24.7 % are endemic. Most of these species are found restricted to the wet and the intermediate zones with some distributed in the dry zone of Sri Lanka. The 1025 endemic plant species are distributed within 98 families 353 genera. It is observed that 163 species (i.e. 15.9% of the total number of endemics) are rare and another 86 species (i.e. 8.3%) are threatened or in the verge of extinction. This publication lists the distributional localities of the taxa concerned so that the user of this book could find where the plant is growing in the field. Further it is hoped that such persons would take necessary measures to preserve and conserve these localities and habitats for the future.
